                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a crystal of a protein-ligand complex comprising a truncated lymphocyte kinase (lck) and a ligand. The crystal diffracts X-rays so that the atomic coordinates of the protein-ligand complex can be determined to a resolution of greater than 5.0 Angstroms. The truncated lck used in the present invention comprises the globular core of the corresponding full-length lck. The present sequence is the full-length human lck protein. The crystal of the present invention may be used to identify kinase inhibitors in screening assays, in drug screening and drug design processes, to design, select or test inhibitors of kinase enzymes, where the inhibitors are used as therapeutics for the treatment and modulation of diseases, disease symptoms or the effect of other physiological events mediated by kinases; having one or more kinase
              modulate apoptosis either ex vivo or in vivo. The sequences presented in ABG796700-ABG79705 are the new variants (NV) 1-36 proteins of the TIGs
modulating endothelial differentiation and proliferation, as well as to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Crystal of a protein-ligand complex for identifying kinase inhibitors, comprises a truncated lymphocyte kinase and a ligand, and diffracts X-rays to determine atomic coordinates at a resolution greater than 5
                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector, a method for identifying a nucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a method for producing a pharmaceutical composition, a conjucty in an animal of one or more of the polypeptides or their antibodies. The polynucleotide or the compound that sequence presented for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polymetises its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene compound the specification) which is differentially expressed during pain. Note: The specification) but was obtained in electronic form directly from WIPO at the printed the contract of the con frp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention discloses a composition comprising two or more isolated rat over human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nuvel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polymicleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for identifying a ligand (L), which binds to an inactive conformation of target protein kinase (T). The method involves contacting inactive conformation of (T), which contains or is modified to contain a reactive group at or near a binding site of interest, with one or more ligand candidates capable of covalently bonding to the reactive group thus forming a kinase-(L) conjugate (C). The method is useful for identifying protein kinase inhibitors that preferentially bind to inactive conformation of a target protein kinase. The present sequence is a protein kinase which may be modified via an amino acid substitution, for use in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying ligand binding to inactive conformation of target protein Kinase (T) comprises contacting the conformation modified (T) which contains reactive group at binding site, with ligands and detecting kinase-ligand conjugate formation.

The invention describes a crystal (I) of a protein-ligand complex (C) comprising a truncated lymphocyte kinase (Lck) and a ligand, where (I) effectively diffracts X-rays for determination of atomic coordinates of (C) to a resolution of greater than 5.0 angstroms, and truncated Lck (C) to a resolution of greater than 5.0 angstroms, and truncated Lck (C) to a resolution of greater than 5.0 angstroms, and truncated Lck (C) to a resolution of greater than 5.0 angstroms, and truncated Lck (C) is useful in an inhibitor screening assay and to length Lck. (I) is useful in an inhibitor screening assay and to identify, design, select, and evaluate potential inhibitors of kinases (C) that are associated with kinase-mediated physiological events. The inhibitors identified by the methods may also be useful for inhibition of kinase activity of one or more enzymes. The inhibitors are also useful for inhibiting the biological activity of any enzyme comprising greater than 90%, alternatively greater than 85%, or alternatively greater than 50% alternatively greater than 85% or alternatively greater than 50% sequence homology with a kinase sequence. The inhibitors are useful for treating disease or disease symptoms mediated by any enzyme that binds ATP. The inhibitors are useful in inhibiting kinase activity and communal, particularly a human e.g., cancer, autoimmunological, metabolic, inflammatory, infection, (bacterial, viral, yeast, fungal, etc.), central nervous system degenerative disease etc. The inhibitors are useful in traating or preventing disease including, transplant rejection etc. This is the amino acid sequence of a human lymphocyte kinase (Lck) comprising the Lck globular core.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

This invention relates to novel protein complexes of the tumour necrosis factor-alpha (TNF-alpha) signalling pathway. Specifically, it refers to methods for preparing these complexes comprising at least two component proteins, as well as screening methods to identify modulators of the pathway, which include antibodies, agonists and antagonists thereof. The present invention describes a protein complex and kit that are useful for diagnosing, prognosing or treating chronic inflammatory diseases such as septic shock and bacterial infections; neurological diseases such as setroke-induced inflammation in neurons; neurological diseases such as stroke-induced inflammation in neurons; neurological diseases such as stroke-induced inflammation in neurons; neurological diseases and cancer. Accordingly, these complexes can be used for the development of pharmaceutical compositions that exhibit antiinflammatory, antiarthritic, antirheumatic, cytostatic and antibacterial activities and can be used for gene therapy purposes. In particular, the invention further provides is IRNA-oligomucleotides useful for inhibiting protein expression for in vitro or cell culture assays. This polypeptide is a human protein that can be used in combination with other proteins provided in the specification, to form novel complexes of the TNF-alpha signalling pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New protein complex comprising at least one first and second protein of
the Tumor Necrosis Factor-alpha(TNF-alpha)-signaling pathway, useful for
diagnosing or treating inflammation, neurological diseases, infectious
                                                                                                                                                                                                                                                                         Human protein of a TNF-alpha signalling pathway protein complex SeqID 3.
                                                                                                                                                                                                                                                                                                                                              protein complex; tumour necrosis factor-alpha signalling pathway; TNF-alpha; chronic inflammatory disease; rheumatoid arthritis; inflammatory bowel disease; infectious disease; septic shock; bacterial infection; neurological disease; stroke-induced inflammation; neurodegenerative disease; cancer; antiinflammatory; antiarthritic; antirheumatic; cytostatic; antibacterial; gene therapy; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bauch A, Ruffner H, Bauer A, Kuester B;

The present invention describes an isolated nucleic acid molecule, which comprises the sequence of any of the genes that are up-regulated or down-comprises the sequence of any of the genes that are up-regulated in apecific cancers (e.g. about 1031 genes up-regulated in acute lymphocytic leukemia). ACC72641 to ACC72860 represent cancer cacter lymphocytic leukemia). ACC72641 to ACC72860 represent cancer cacter absence of a pathological cell in a patient; (2) an expression vector absence of a pathological cell in a patient; (2) an expression vector comprising the vector; (4) an isolated polypeptide, which is encoded by the netting a nucleic acid, (5) an antibody that specifically binds the polypeptide of (4); (6) specifically targeting a compound to a pathological cell in a patient by administering to the patient the antibody above; and (7) a comprising a pathology, e.g. cancer (e.g. cancer of the bone marrow, chargeness, pressing a pathology, e.g. cancer (e.g. cancer of the bone marrow, collader, brain, breast, cervix, colon/rectum, kidney, lung, ovary, collader, brain, breast, cervix, colon/rectum, kidney, lung, ovary, contracters, prain, breast, cervix, colon/rectum, kidney, lung, ovary, atherosclerosis and endometriosis. The nucleic acid is also useful in the content of drug screening, particularly for identifying agents for treating these contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New genes that are up-regulated or down-regulated in cancers, useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 markers for diagnosing e.g. cancer, ischemia or heart diseases, or as therapeutic targets for screening drugs for treating these diseases.
                                                                                                                                       Human, cancer; diagnosis; screening; modulator; leukaemia; ischaemia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a crystalline polypeptide (1), comprising the catalytic domain of human Lymphocyte Cell Kinase (Lck) protein. Lck is a Src-family protein tyrosine kinase expressed primarily in T-cells and plays an essential role in immune response. The present sequence is the full-length sequence of human Lck (1-509). (1) is useful for identifying a compound which is an inhibitor of human Lck protein
                                                                                                                                                                                                                                                 Human; protein co-ordinate data; Lymphocyte Cell Kinase; Lck; enzyme; Src-family protein tyrosine kinase; T-cell; immune response.

Claim 1; SEQ ID NO 28; 167pp; English.

```
The invention relates to a method of identifying a compound useful in the treatment of AIDS (acquired immunodeficiency syndrome) or an HIV (human immunodeficiency virus) related disorder. The invention involves assaying the ability of a test compound to modulate the activity or expression of 26 human proteins. These proteins and nucleic acids encoding them (ADE4022-ADE40473) are differentially expressed in tissues relating to AIDS or an HIV-related disorder compared to their expression in normal tissues. The invention also relates to the use of the compounds candentified to modulate viral replication in a cell and to treat a patient with AIDS or an HIV-related disorder. The invention further discloses methods for the diagnostic evaluation and prognosis of various HIV-clated disorder. The invention further discloses method disorders, and for the identification of individuals exhibiting a predisposition to such modulatory compounds identified using the method of the invention may be small organic molecules. The methods of peptides, antibodies or antisense nucleic acid molecules. The methods of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the invention are useful in diagnosing, preventing or treating AIDS or HIV-related disorders. The present sequence represents a human protein which is differentially expressed in AIDS or HIV-related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                     rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, pancreas individual. The method is also useful in assessing the immune status of an individual. The method see also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple solerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.

                                                                                                                                                                                                                                                                                  The specification describes a method for identifying protein kinase inhibitors that preferentially bind to the inactive conformation of a target protein kinase. The inhibitors are identified by locking the target protein kinase in an inactive conformation, and using Tehrering to identify inhibitors preferentially targeting the inactive conformation. The method of the invention is useful for identifying a ligand which binds to an inactive conformation of a target protein kinase. The present sequence represents the human Tyr kinase Lck. Lck variants were used to demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying compound which modulates Src family kinase (SFK) activity, by contacting cells expressed with SFK or mutated SFK with test compound, where change in phenotype of cells indicates that test compound modulates SFK activity.
Identifying ligand binding to inactive conformation of target protein kinase, by contacting inactive conformation of target with ligand candidates specific to target, detecting formation of kinase-ligand conjugate and identifying ligand.

The invention relates to a method (M1) for identifying, selecting and/or characterizing a compound which modulates Src family kinase (SFK)

cativity, by expressing nucleic acids encoding SFK or mutated SFK in cells, contacting cells with test compound and determining whether phenotype of cells is changed as compared with phenotype of cells not expressed with above nucleic acids, where difference in phenotype indicates that test compound and/or characterized by (M1); and (2) a compound (1) identified, selected and/or characterized by (M1); and (2) a pharmaceutical composition (PCI) containing (I), and a carrier, adjuvant or vehicle. (I) is useful as a medicament, particularly for the treatment of diseases, which are at least in part caused by a Src family kinase. (I) and PCI are useful for producing a medicament for the treatment of diseases, which are at least in part caused by a Src family kinase, particularly by a dysfunction of a Src family kinase, in particular cancer, hypercalcemia, restenosis, osteoporosis, osteoarthritis, inflammatory bowel disease, multiple Src family kinase, in particular caused by a Src family kinase, in family and sease, results of the sease, rell mediated hypersensitivity disease, inflammatory bowel disease, multiple solerosis, sociacid arthritis, restenosis, solerosis, sociacid arthritis, versus host disease, reall mediated hypersensitivity disease, submaniant of bone metastasis, sociacid arthritis, respectively contact demartitis, paget's disease, asthma, isochemic or reperfusion injury, allergic disease, atopic dermatitis, transplant rejection or allergic rhinitis. The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A polymucleotide of the invention may have a use in gene therapy. The human ciagnostic and therapeutic polymucleotides (dithp) or polymeptides may be used to diagnost a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, neurological disorders, developmental disorders, or disorder, neurological disorders, dastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or Claim 27; Page; 190pp; English in gene mapping.

5. FUNCTION: Tyrosine kinase that plays an essential role for the selection and maturation of developing T-cell in the thymus and in mature T-cell function. Is constitutively associated with the cytoplasmic portions of the CD4 and CD8 surface receptors and transduction pathways. Association of the TCR with a peptide antigen-bound MHC complex facilitates the interaction of CD4 and CD8 with MHC class II and class I molecules, respectively, and thereby recruits the associated LCK to the vicinity of the TCR/CD3 complex. LCK then phosphorylates tyrosines residues within the immunoreceptor tyrosines-based activation motifs (ITAMS) in the cytoplasmic tails of the TCR/GD3 subunits, initiating the TCR/CD3 signaling pathway. In addition, contributes to signaling by other receptor molecules. Associates directly with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to peptides which are partial sequences of stor/lok family proteins. The present sequence is one such peptide. The peptides are useful for producing vaccines for the treatment of cancer, including colon cancer and small-cell lung cancer.
                                                                                                                                                                                                                                                  Src protein; lck protein; vaccine; colon cancer; small-cell lung cancer.

                                                                                                                                                                                                                                                                                                        Identifying compounds for modulating kinase-associated signal transduction and treating cancer, by synthesizing compounds having short sequences identical to native sequences appearing in specific region of a
                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises a method for identifying compounds for the modulation of kinase-associated signal transduction. The invention also comprises a number of peptides which modulate kinase-associated signal transduction. The method of the invention is useful for identifying compounds for the modulation of kinase-associated signal transduction. The kinase-associated signal transduction modulating peptides of the invention are useful for treating idabetes; cancer; obesity; bone healing; alopecia; osteoporoasis; albetes; cancer; obesity; bone healing; alopecia; osteoporoasis; atheroselerosis; skin disorders; central nervous system disease; inflammation; restenosis; and manatory disorders; diseases; and cardiovascular diseases. The peptides ABJ04160 represent the kinase-associated signal transduction modulating peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Identifying compounds for modulating kinase-associated signal transduction and treating cancer, by synthesizing compounds having short sequences identical to native sequences appearing in specific region of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Kinase; A-region; PKA; PKA-Calpha; signal transduction; inhibitor; stimulator; proliferation; differentiation; oncogenesis; cancer; stretisoclarosis; psoriasis; septic shock; therapeutic; diabetes; obesity; restenosis; tissue remodeling; bone healing; alopecia; scarring; osteoporosis; neurodegenerative disease; autoimmune disease; incliammation; atherosclerosis; skin disorder; central nervous system; all lammation; atherosclerosis; skin disorder; central nervous system;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises a method for identifying compounds for the modulation of kinase-associated signal transduction. The invention also comprises a number of peptides which modulate kinase-associated signal transduction. The method of the invention is useful for identifying compounds for the modulation of kinase-associated signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              healing; alopecia; osteoporosis; neurodegenerative disease; autoimmune disease; inflammation; restenosis; atherosclerosis; skin disorders; central nervous system disease; inflammatory disorders; autoimmune diseases; and cardiovascular diseases. The peptides ABJ04169 - ABJ04300 represent the kinase-associated signal transduction modulating peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    invention are useful for treating: diabetes; cancer; obesity; bone healing; alopecia; osteoporosis; neurodegenerative disease; autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The kinase-associated signal transduction modulating peptides of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention discloses compounds, or variants of them, and methods for identifying and synthesising the candidate compounds which comprise a peptide region in the protein kinase A-region (PKA). This region is determined by aligning catalytic subunits of the kinase and PKA-Calpha and determining the sequence of the kinase corresponding to positions 92-109 of PKA-Calpha. The capacity of the compound to modulate the signal transduction associated with the kinase semediate signal transduction in a wide variety of cellular events, such as cell proliferation, differentiation, oncogenesis and immune/inflammatory responses. Enhanced stimulation can lead to proliferative diseases, such as cancer, arteriosclerosis, psoriasis and septic shock. The methods and compositions are useful for detecting A-region ligands and for treating a composition of a signal transduction associated with a kinase, where the kinase from which the Aregion and where the kinase associated with the signal transduction, and where the disease is diabbetes, cancer, with the signal transduction, and where the disease is diabbetes, cancer, with the signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   obesity, restenosis, tissue remodeling including improved bone healing, prevention of alopecia, reduced scarring, osteoporosis, neurodegenerative disease, autoimmune disease, inflammation, atherosclerosis, skin disorders, diseases of the central nervous system and cardiovascular diseases. The sequences presented in ABUS41215-ABUS4336 are the A-region peptides disclosed in the invention which are N-myristylated and C-
                                                                                                                                                                                                                                                                                                                                         Identifying candidate compounds for the modulation of kinase-associated signal transduction, useful for treating diabetes, cancer, obesity, osteoporosis, autoimmune disorders, atherosclerosis and cardiovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         restenosis; bone healing; alopecia; osteoporosis;

The invention discloses compounds, or variants of them, and methods for identifying and synthesising the candidate compounds which comprise a peptide region in the protein kinase A-region (PKA). This region is so determined by aligning catalytic subunits of the kinase and PKA-clapha and determining the sequence of the kinase corresponding to positions 92-109 of PKA-Calpha. The capacity of the compound to modulate the signal transduction associated with the kinase sea corresponding to positions 92-109 of PKA-Calpha. The determined. Protein kinases mediate the signal transduction in a wide variety of cellular events, such as cell transduction in a wide variety of cellular events, such as cell transduction, differentiation, oncogenesis and immune/inflammatory responses. Enhanced stimulation can lead to proliferative diseases, such as cancer, arteriosclerosis, psoriasis and septic shock. The methods and compositions are useful for detecting A-region ligands and for treating a disease where a therapeutically beneficial effect may be evident by the modulation of a signal transduction, and where the disease associated with the signal transduction, and where the disease associated with the signal transduction, and where the disease is diabettes, cancer, obesity, restenosis, tissue remodeling including improved bone healing, prevention of alopecia, reduced scarring, osteoporosis, neurodegenerative diseases, autoinmune disease, inflammation, atherosclerosis, skin diseases, autoinmune disease, inflammation, atherosclerosis, skin diseases. The sequences presented in ABUS4155-ABUS4336 are the A-region and cardiovascular diseases. The sequences presented in ABUS4155-ABUS4336 are the A-region and cardiovascular diseases disconsed in the invention which are N-myristylated and C-pariety and and cardiovascular and cardiovas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                     Identifying candidate compounds for the modulation of kinase-associated
                                                                                                                                                                                                                                                                                                                                                                                                        signal transduction, useful for treating diabetes, cancer, obesity, osteoporosis, autoimmune disorders, atherosclerosis and cardiovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Prediction; secondary structure, alignment; evolutionary conservation; homology; periodicity; co-variation analysis; antigenic site; site directed mutagenesis; interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

Positions in the alignment are assigned to the surface or inside of the folded structure, active sites, and parsing segments. Secondary structural units are assigned by identifying periodicity in the assignments, and assembled into globular form using distance constraints imposed by disulfide bridges, active site assignments and co-variation analysis. The predicted secondary structures are useful for identifying antigenic sites on a protein molecule, as guides for site directed mutagenesis studies, and for understanding the interaction of a protein with other molecules
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Designing a ligand binding to a target molecule, comprises identifying as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New crystalline polypeptide comprising ligand binding domain or catalytic domain of Lck protein, for determining three-dimensional structure of catalytic domain of Lck, has predetermined unit cell parameters.
                                                                                                     The present invention relates to a method of designing a ligand binding to a target molecule. The method involves identifying as molecular scaffolds compounds binding to members of a molecular family, detecting orientation of scaffolds at a binding site of target, and synthesising ligand. The invention is useful for designing drug products and for designing ligand binding to target molecules such as nuclear hormone receptors, TNF receptors, G-protein coupled receptors, methyl transferases, ligases, etc. The present sequence is the LCK tyrosine kinase protein. This sequence is used to illustrate the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "Wild-type D substituted with N.              The present invention relates to a crystalline polypeptide (I), comprising the catalytic domain of human Lymphocyte Cell Kinsae (Lck) protein. Lck is a Src-family protein tyrosine kinsae expressed primarily in T-cells and plays an essential role in immune response. (I) is useful for identifying a compound which is an inhibitor of human Lck protein. The present sequence is a mutated fragment of the human Lck sequence, which approximately comprises the catalytic domain

The invention relates to a new kinase scaffold library comprises at least 1 set of compounds, each set comprising at least 1 N-heterocyclic compound of formulae (1)-(VII) given in the specification. Also included are a system for fitting compounds in binding sites of protein kinases (comprising at least 1 collection of electronic representations of [I]-(VII), where the scaffold library is embedded in a computer device and the electronic representations of the compounds can be selectively cerrieved and functionally connected with computer software adapted to fit electronic representations of compounds in an electronic representations of which compounds can be selectively cerrieved and functionally connected with computer software adapted to fit electronic representations of compounds in an electronic conficulation of a binding site of a kinase), obtaining improved ligands binding to the kinase with greater for specificity for the particular kinase (which comprises has greater for specificity for the particular kinase than (I)-(VII)), developing ligands specific for a particular kinase (which comprises has greater for specificity for the particular kinase than (I)-(VII), developing ligands binding to a kinase (which comprises of the corystals with the kinase, identifying chemical structures of the scaffolds, that, when modified, change the binding affinity and/or specificity between the scaffold and kinase and synthesizing a ligand in which are least 1 chemical structures of the scaffolds is modified).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            developing ligands with increased specificity on a kinase (which comprises testing a derivative of a kinase binding compound (I)-(VII) for increased specificity on the kinase), identifying a ligand binding to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Kiname; protein co-ordinate data; protein structure; cancer; cytostatic; neoplasm; inflammation; antiinflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New scaffold library used for identifying and developing ligands for protein kinases and treating kinase associated disorders e.g. cancer, comprises set of compounds comprising N-heterocyclic compounds.

kinase (which comprises determining if a derivative compound including a core structure (I) (VII) binds to the kinase with changed binding affinity and/or specificity, a co-crystal of a kinase and a binding compound (I) (VII), preparation of co-crystals of Pin-1 with (I) (VII), identifying potential kinase binding compounds (which comprises fitting electronic representations of (I) (VII) in an electronic representation of a kinase binding compound to an attachment component (which comprises identifying energetically allowed sites) component at the allowed site), modified compounds (comprise) (I) (VIII) and attachment of the compound or derivative to the attachment (I) (VIII) and attachment at the allowed site), modified compounds (comprising (I) (VIII) comprising conserved residues matching at least on of Pim-1 residues 49, component at the allowed site), and developing a ligand for a kinase comprising conserved residues matching at least on of Pim-1 residues 49, component an attached linker group, and developing a ligand for a kinase comprising conserved residues matching at least on of Pim-1 residues 49, component and the factor receptor, endothelial growth factor receptor, endothelial growth factor receptor, endothelial growth factor receptor, endothelial growth factor receptor, condition associated with abnormal kinase activity e.g. cancer, condition associated with abnormal kinase activity e.g. cancer, condition associated with abnormal kinase activity and specificity towards kinase. The co-crystals of kinase activity and specificity or a condition associated with abnormal kinase activity e.g. cancer, chinase resulting in ligands having high affinity and specificity towards kinase. The co-crystals of kinase and the binding compound are of sufficient size and quality to allow structural determination of at least constitutions amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

This sequence represents a human protein kinase homolog (PKH) of the invention. The PKH sequences may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PKH expression such as cancers, autoimmune/inflammatory disorders and reproductive defects. They may be used to treat disorders associated with decreased PKH expression such as cancers (e.g. lymphoma, melanoma and cancers of the breast lung and prostate), autoimmune/inflammatory disorders (e.g. AIDS, asthma and diabetes mellitus), and reproductive defects (e.g. AIDS, asthma and diabetes mellitus), and reproductive defects (e.g. AIDS, asthma and diabetes mellitus), and reproductive defects (e.g. AIDS, asthma and diabetes mellitus), so administered to treat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of syndrome). The DNA may be administered to treat diseases by rectifying mutations or fell-ions in a patient's genome that affect the activity of product PKH, according to standard recombinant DNA methodology, by produce PKH, according to standard recombinant DNA methodology, by produce PKH, according to standard recombinant DNA methodology, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. Conversely, antisense mutation of proventing their expression. The DNA, and antisense sequences may also be used to study the expression. The DNA, and antisense sequences may also be used to study the expression and function of ERH polypeptides and duantitate the presence of similar nucleic acid sequences in samples, and hence which patients may be in need of restorative therapy. They may also be used to study the expression and function of ERH antibodies and attained the presence of similar nucleic acid sequences in calculate the production of antibodies against PKH and in assays to identify.

CHALLED PKH antibodies and pKH antagonists may also be used to down regulate for detecting the presence of PKH expression and activity. The samiles

```
The present sequence is human protein kinase homolog-3 (PKH-3). Human protein kinase homologs (PKH) and their cDNA molecules are used in the prevention, diagnosis and treatment of diseases associated with increased or decreased expression of PKH. Examples of such disorders include, cancer (e.g. adenocarcinoma, melanoma and bone, breast and liver cancer), ancer (e.g. adenocarcinoma, asthma, Crohn's disease and multiple sclerosis) and reproductive disorders (e.g. tubal disease, ectopic pregnancy and reproductive disorders (e.g. tubal disease, ectopic pregnancy and colycystic ovary syndrome). PKH, its catalytic or immunogenic fragment are used for screening libraries of compounds in any of the drug screening techniques. PKH nucleic acids are used to generate hybridisation probes useful in mapping the naturally occurring genomic sequences. PKH are also used as antigens in the production of antibodies against protein kinases (PK) and in assays to identify modulators of PK expression and activity. PKH is also used in protein therapy
                                                                                                                                                                                                                                                                                 diagnosing and treating cancers, autoimmune/inflammatory disorders and reproductive disorders.
                                                                                                                                 Corley NC;
                                                                                                                                                                                                                                                           Human protein kinase proteins and homologs, useful for preventing,

Nucleic acids encoding a human protein kinase homolog useful for preventing, diagnosing and treating cancer, autoimmune/inflammatory disorders and reproductive defects.

Claim 47; Page 27; 43pp; English.

Copyagetides which have cytostatic, immunosuppressive, antilitlammatory, antiallergic, antiasthmatic, antianaemic, antiarteriosclerotic, antiallergic, antiasthmatic, immunosuppressive, antiallergic, antiasthmatic, mostropic, antiarthritic, antithoratic, nootropic, osteopathic, antiarthritic, antithematic, cophthalmological, antiparasitic and antiarthritic, antithematic, cophthalmological, antiparasitic and antiarthritic activity. The polypeptide is used for treating a disease or condition associated with decreased expression of functional PKH The polypeptide is used to screen for agonists and antagonists of PKH whitch can also be used in disease.

Corputed immunodeficiency syndrome (AIDS), Addison's disease, adult respiratory distress syndrome, allergies, antivolumne haemolytic anaemia, asthma, atherosclerosis, autoimmune thyroiditis, bronchitis, cholecystitis, cancer, contact dermatitis, Crohn's disease, atopic dermatitis, dermatomyositis, antoimmune thyroiditis, bronchitis, cholecystitis, cancer, contact dermatitis, crohn's disease, atopic dermatitis, dermatomyositis, disease, atopic dermatitis, dermatomyositis, cholecystitis, contact dermatitis, arritable bowel syndrome, multiple sclerosis, thyroiditis, hypereosinophilia, irritable bowel syndrome, multiple sclerosis, thyroiditis, osteoporosis, pancreatitis, polymyositis, psoriasis, cereoarthritis, osteoporosis, pancreatitis, polymyositis, polymyositis, psoriasis, cereoarthritis, osteoporosis, pancreatitis, molymositis, pancreatitis, protection, viral, brancolalysis, and extracorporeal circulation, viral, brancolalysis, and extracorporeal circulation viral, brancolalysis, and extracorporeal circulation viral, brancolalysis, and extracorporeal circulation syndrome, economical and paramited and paramited solutions of the ostroors, undermy defects, and endometrial and ovarian tumours, uterine fibroids, autoimmune disorders, ectopic prequencies, and teratogenesis. The polypeptides of the invention contact dermatory. This sequence represents a PKH from clone of fr from non-adherent peripheral blood mononuclear cells collected from a pool of male and female donors This invention describes a novel protein kinase homologue (PKH)

New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosting a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or in gene mapping.

N-PSDB; ACN41632

Claim 27; Page; 190pp; English.

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorder, developmental disorders, autoimmune/inflammatory disorders, developmental disorders, or disorder, neurological disorders, dastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm

modulates Tlymphocyte activation. The method comprises contacting a Cell comprising an A-raf-1 or TCPTP/PTRN2 polypeptide with a compound, where the A-raf-1 or TCPTP/PTRN2 polypeptide with a compound, call comprising an A-raf-1 or TCPTP/PTRN2 polypeptide with a compound, acid that hybridises to a nucleic acid encoding a polypeptide having a sequence selected from two 606-amino acid sequence and a 415-amino acid sequence given in the specification. The method of the invention has immunosuppressive, antiasthmatic, antiallargic, and antiinflammatory activity. The method is useful for identifying compounds that modulate lymphocyte activation and migration, and for monitoring changes in cell surface marker expression, cytokine production, antibody production, proliferation and differentiation, and apoptosis, using either cell lines or primary cells. The A-raf-1 or TCPTP/PTRN2 proteins may be used as activation and migration, eag. for the treatment of diseases in which modulation of the immune response is desired such as delayed type hypersensitivity reactions, asthma, allergies, graft versus host disease, and acute and chronic inflammation. Modulators of lymphocyte activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a compound that modulates T lymphocyte activation, useful for monitoring changes in cell surface marker expression, comprises contacting a T cell comprising an A-raf-1 or TCPTP/PTPN2 polypeptide with

```
The invention relates to a compound targeted to a nucleic acid molecule encoding the human lymphocyte specific tyrosine kinase (Lok) polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human Lck polypeptide and in preparation of a composition for treating human Lck polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        preventing and/or treating diseases or conditions associated with aberrant expression or activity of Lck, such as hyperproliferative
                                                                                                                                                                                                       Human lymphocyte specific tyrosine kinase (Lck) polypeptide #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotide compounds, useful for diagnosing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention discloses isolated human nucleic acid alternative splicing variants that are all tumour-involved genes (TIGS). The nucleic acids and polypeptides are useful for determining the level of a nucleic acid or polypeptide in a biological sample, for deterting a variant nucleic acid or polypeptide sequence in a biological sample, for determining the level of variant nucleic acid or polypeptide sequences in a biological sample and for variant between the level of variant sequence in a first biological sample and for raising antibodies. A pharmaceutical composition comprising a carrier and the nucleic acid, is useful for the variant diseases (e.g. cancer) that can be ameliorated or cured by increasing the level of the encoded protein. The nucleic acids are also useful for diagnostic purposes, especially for detecting cancer or a predisposition to cancer, for evaluating the state or aggressiveness of cancer disease, in basic research, for understanding the physiological function of the original TiG in targeting or developing pharmaceuticals, for distinguishing various stages in the life cycle of the same type of cells which may be helpful for the development or or predispositions cancer stages in which cell cycle is noncommal, for determining mutations in tumour-involved genes and in gene therapy. The polypeptides are useful for identifying compounds capable of binding to the variant product and modulating its activity and for modulating endochelial differentiation and proliferation, as well as to modulate apoptosis either ex vivo or in vivo. The sequences presented in Assistants (NV) 1-36 proteins of the TIGs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 anti-HIV; antiallergic; antiinflammatory; antianaemic; antiparkinsonian; nootropic; anticonvulsant; antiarteriosclerotic; antiasthmatic; immunosuppressive; antithyroid; cytostatic; hepatotropic; dermatological;
                                                                                                                                                                                                                                                                                           Novel nucleic acid sequence, which is an alternative splicing variant of tumor involved genes, useful for detecting cancer, predisposition to cancer, for evaluating cancer state and in gene therapy for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 49; DB 5; Length 437; llarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fused polypeptide - has amino acid sequence of beta-galactosidase with a LCK gene conjugated to the N-terminal via DNA having multi-cloning site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          galactósidase gene fused with the lck gene. It is produced by E.coli transformed with a recombinant vector (see AAQ13983). It is useful for producing an antibody specifically immunoreactive with only a lck genederived polypeptide in T cells. The antibody may recognise lck genederived polypeptides in human cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              pharmaceutical composition; cancer; diagnostic; tumour; gene therapy; endothelial cell; cell differentiation; cell proliferation; apoptosis; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   kinase and phosphatase (KPP). The KPP polypeptides, polynucleotides, agonists and antagonists are useful for diagnosing, treating or preventing cell proliferative disorders such as atherosclerosis, cirrhosis, hepatitis and cancer, developmental disorders e.g. mental retardation, neurological disorders including Alzheimer's disease and Parkinson's disease and inflammatory disorders such as Crohn's disease and diabetes mellitus and finally, viral, bacterial, fungal, parasitic, protozoan or helminthic infections. Furthermore, the polymucleotides encoding KPP may be useful for creating transgenic animals to model human disease, as well as during gene therapy procedures. The current sequence is that of the human KPP protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel isolated polypeptide which is a human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a crystal of a protein-ligand complex comprising a truncated lymphocyte kinase (lck) and a ligand. The crystal diffracts X-rays so that the atomic coordinates of the protein-ligand complex can be determined to a resolution of greater than 5.0 Angstroms. The truncated lck used in the present invention comprises the globular core of the corresponding full-length lck. The present sequence is the full-length human lck protein. The crystal of the present invention may be used to identify kinase inhibitors in screening assays, in drug screening and drug design processes, to design, select or test inhibitors of kinase enzymes, where the inhibitors are used as therapeutics for the treatment and modulation of diseases symptoms or the effect of other physiological events mediated by kinases, having one or more kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which respresents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a carrier issue of the polynucleotide sequence that is differentially expression of the polynucleotide sequence the is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypucleotides of ridentifying a compound or small molecule that regulates the activity in an animal of one or more of the polypucles of the identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating bain and a pharmaceutical composition comprising the one or more composition computation the compound that molypeptides or their antibodies. The polypucleotide or the compound that molypeptides or their antibodies. The polypucleotide or the compound that molypeptide in an animal merve injury (fund), changed medicament for treating pain (e.g. spinla segmental nerve injury (fund), an animal decomposition comprising a method or decomposition comprising a method or decomposition comprising a method or decomposition computation or or more or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                        New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 49; DB 7; Length 508; 100.0%; Pred. comprising the vector comprising the movel polynuclectide, a host cell comprising the vector, a method for identifying a nuclectide dequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynuclectide sequence that increases or decreases the expression of the polynuclectide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynuclectide sequence which is differentially expression of a polynuclectide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynuclectides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of polypeptides or their antibodies. The polynuclectide or the compound that composition a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more configurates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene for the sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note:

The sequence data for this patent did not form directly from WIPO at the print of the printed or the composition or meaning the configuration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  fragment,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention discloses a composition comprising two or more isolated or human polynucleotides or a polynucleotide which represents a fragme derivative or allelic variation of the nucleic acid sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for identifying a ligand (L), which binds to an inactive conformation of target protein kinase (T). The method involves contacting inactive conformation of (T), which contains or is modified to contain a reactive group at or near a binding site of interest, with one or more ligand candidates capable of covalently bonding to the reactive group thus forming a kinase-(L) conjugate (C). The method is useful for identifying protein kinase inhibitors that preferentially bind to inactive conformation of a target protein kinase. The present sequence is a protein kinase which may be modified via an amino acid substitution, for use in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               fungicide, nootropic, neuroprotective, kinase inhibitor; crystal; protein-ligand complex; lymphocyte kinase; Lck; Lck ligand; kinase inhibitor; therapeutic; kinase-mediated physiological event; cancer; autoimmunological; metabolic; inflammatory; infection; central nervous system degenerative disease; transplant rejection; human; globular core; protein co-ordinate data.

Comprises a sequence (S1) of residues 225-508 of a 508 amino acid sequence, given in specificater than 5.0 angstroms, and truncated Lck comprises a sequence (S1) of residues 225-508 of a 508 amino acid sequence, given in specification and retains the globular core of full-length Lck. (I) is useful in an inhibitor screening assay and to identify, design, select, and evaluate potential inhibitors of kinases that would be useful as therapeutics for diseases or symptoms of diseases that are associated with kinase-mediated physiological events. The inhibitors identified by the methods may also be useful for inhibition of kinase activity of one or more enzymes. The inhibitors are also useful criminate in the biological activity of any enzyme comprising greater than 70% sequence homology with a kinase sequence. The inhibitors are useful criminate for treating disease or disease symptoms mediated by any enzyme that binds ATP and thus for treating disease or disease symptoms mediated by any enzyme that binds ATP inhibitors are useful in inhibiting kinase activity and are useful in treating kinase enclosed disease or disease symptoms in a marmal particular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mammal, particularly a human e.g., cancer, autoimmunological, metabolic, inflammatory, infection, (bacterial, viral, yeast, fungal, etc.), central nervous system degenerative disease etc. The inhibitors are useful in treating or preventing diseases, including, transplant rejection etc. This is the amino acid sequence of a human lymphocyte kinase (Lck)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human protein of a TNF-alpha signalling pathway protein complex SeqID 3.
                                                                                                                                                                                                                                                                                                                                                    The invention describes a crystal (I) of a protein-ligand complex (C) comprising a truncated lymphocyte kinase (Lck) and a ligand, where (I) effectively diffracts X-rays for determination of atomic coordinates of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     protein complex; tumour necrosis factor-alpha signalling pathway; TNF-alpha; chronic inflammatory disease; rheumatoid arthritis; inflammatory bowel disease; infectious disease; septic shock; bacterial infection; neurological disease; stroke-induced inflammation; neurodegenerative disease; cancer; antiinflammatory; antiarthritic; antirheumatic; cytostatic; antibacterial; gene therapy; human.
